TITLE:

Electrical field over complex vertically-polarized

conducting spheres

PERIODICAL:

Referativnyy zhurnal, Geofizika, no. 3, 1962, 25-26, abstract 3A215 (V sb. Vopr. rudn. geofiz., no. 2, M.,

Gosgeoltekhizdat, 1961, 61-67)

TEXT: Having replaced the electrical field of evenly polarized spheres by the fields of dipoles inserted at the centers of these spheres, and using the method of mirror images, the following expression was derived for the electrical field potential on a flat ground surface from two polarized spheres, in which the influence of the reflected spheres is taken into account by simple duplication:

Card 1/4

Electrical field over ...

arm maner

S/169/62/000/003/027/098 D228/D301

$$U_{n} = 2Pz_{0} \sum_{n=0}^{n=\infty} (-1)^{n} a^{3n} \left(\frac{1}{r_{2n}^{3}} + \frac{1}{r_{2n+1}^{3}} \right) \sum_{k=-1}^{k=n-1} \frac{1}{d_{k}^{3}}$$

Here, P is the coefficient, depending on the dipole moment; a is the radius of the polarized sphere; z_0 is the depth of the sphere's centers; r_0 , r_1 , ... r_{2n+1} is the distance from the dipoles (actual or reflected) to the point where the potential is determined; and d_0 , d_1 ... d_n is the distance from the sphere's center (actual or reflected) to the dipoles arranged in the adjoining sphere. Calculations from this formula are cited for the profile passing cases are considered: 1) The immersion depth of one sphere (z_1) is constant, but the depth of the other (z_2) is increased; 2) the depth Card 2/4

Electrical field over ...

S/169/62/000/003/027/038 D228/D301

and distance between the spheres are constant, but the polarization intensity of one of the spheres is increased. In the first case the minimum of the potential's curve over the sinking sphere gradually decreases, and when $z_2/z_1 = 1.5$ and $d_0/z_1 = 1.5$ it changes into a "step"; when $z_2/z_1 = 3.5$ and $d_0/z_1 = 1.5 - 2.5$, however, the curve's asymmetry, which is hardly noticeable at an immersion depth $z_2/z_1>5$, is only observed. In the second case the minima of the potential's curve which correspond to separate spheres, are clearly divisible, even if the polarization intensity of one sphere is 4-5times less than the other. The change in the intensity of polarization of one of the spheres influences the form of the potential's curve much less than the change in the spheres' depth. The results of the conducted investigations showed that the complex of the polarized spheres is marked by a common minimum, on whose background, depending on the distance and the depth, the separate spheres are marked either by local minima and "steps", or not at all. Local minima are conspicuously displayed when the depths of the sphere's Card 3/4

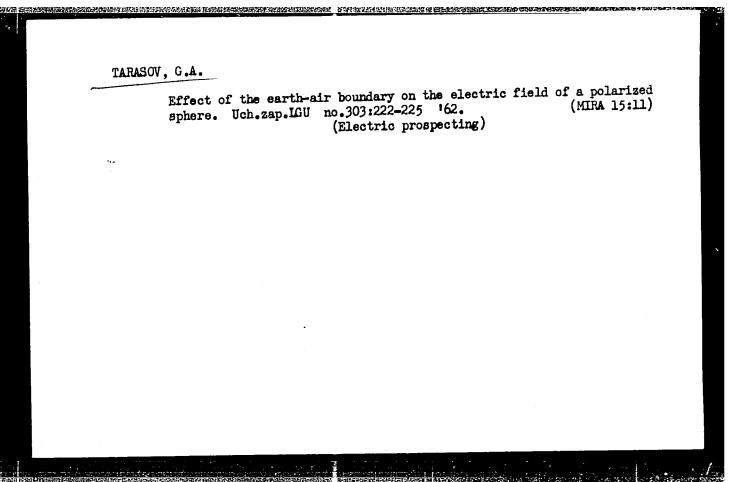

Electrical field over ...

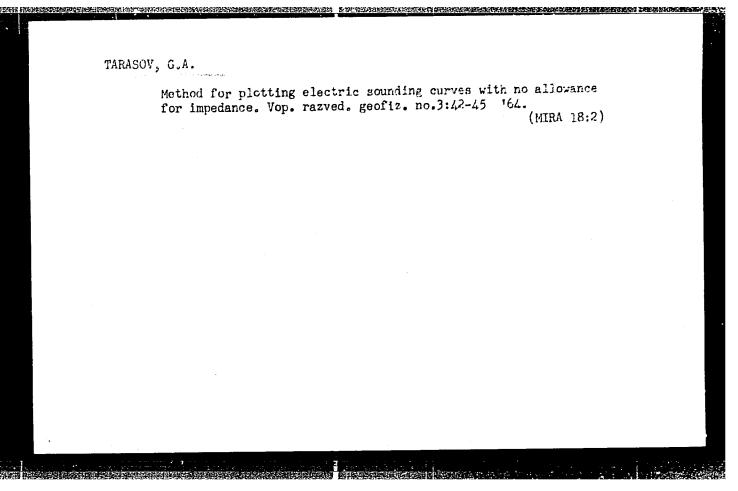

S/169/62/000/003/027/098 D228/D301

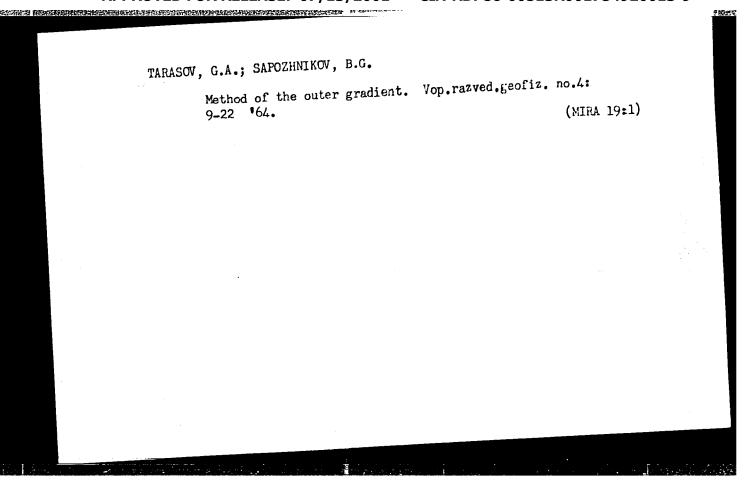

centers do not exceed the distance between them or the centers of the minima. Since the asymmetry of the curve and the "step" on the potential's curve can be due to other causes. then in the absence of secondary minima it is possible without additional data to judge whether neighboring bodies are present. The center of the extreme cannot correspond to the epicenter of the body, and to determine the character of the source in this case it is necessary to use the data of other geophysical methods. The depth of the complex of spheres is determined from the side branches of the potential's curves. / Abstracter's note: Complete translation. /

PHASE I BOOK EXPLOITATION SOV/3255

Tarasov, G., and I. Mikhaylov

Reaktivnoye oruzhiye (Missile and Rocket Weapons) Moscow, Izd-vo DOSAAF, 1959. 46 p. 38,000 copies printed.

Ed.: M.D. Kanevskaya; Tech. Ed.: G.I. Blazhenkova,

PURPOSE: The booklet is intended for the general reader interested in military science and armaments.

COVERAGE: This booklet, based mainly on non-Soviet sources, surveys the leading types of missiles used by the military. The first part of the booklet discusses the principles of reaction propulsion and analyses the different types of fuel employed. The second part of the work describes individual missiles and rockets, mainly those of the United States Armed Forces. No personalities are mentioned. There are 6 English references.

LATE. STRUCTURE AND PROPERTIES OF ELECTRICAL CARBON HIXTURES. III. STRUCTURE OF REPORTES OF CKE-CARRY BLICK PICE HIXTUR & AS A PRINCIPLO OF THE COMPOSITION. Torreson, G. Yo. and Floken, A.S. (20. Trial, R. in. I). appl. Chem., Rescail, 1955, Vol. 20, 53-68; abstr. in Chem. Abstr., 1956, vol. 50, 10381). The physical and mechanical properties, supported by nicroscopic examination divide coke-carbon block (1)-pitan mixtures into groups. (1) in nixtures with 5-30 volume & I the coke skeleton continuous. The limiting shearing stress, P m remains procedually constant, the bulk donsity, a, increases, and the specific electric resistivity, C , decreases. (2) In nixtures with 30-50% I the structure of coke is replaced by that of I, and the process is complete at 50% I Ps passes through a minimum at about 10% I, a and C increase. (3) in nixtures containing 50-100s I the structure of I deminates. Pm increases, passing through a transition point at 70s I; a and C increase gradually up to 80-90% I and then abruptly. C.A.	And the second s
